stem length	SL	mm The original stem: measured from the center of the steerer tube to the center of the handlebar.
crank length	CL	mm The distance from the center of the bottom bracket to the center of the pedal axle.
headtube length	HTL	mm The distance between the upper and lower headset.
head angle	HA	° The angle of headtube to the ground.
seattube angle	STA	° The angle of seattube to the ground.
chainstay length	CSL	mm The distance from the center of the bottom bracket to the center on the rear axle.
bottom bracket height	BBH	mm The vertical distance from the center of the bottom bracket to the ground.
bottom bracket drop	BBD	mm The vertical distance the bottom bracket is below an imaginary horizontal line drawn through the axles.
wheelbase	WB	mm The distance between the axles.
center to top	CT	" The distance from the center of the bottom bracket to the top of the seat tube.
inseam range	I	" If your inseam is within this range, this size of bike should fit you.

You need plenty of clearance to be able to control the bike in all terrain.

The most important measurement when buying a bike, because it cannot be changed.

This is where you spend your time. (The next two measurements show how it can be adjusted.)

A stem which is 30mm longer than original is the maximum recommended to retain optimum handling.

A rider with long legs can benefit from longer cranks.

Affects how high your handlebar is relative to your saddle.

Tailored to optimize steering precision on each frame size.

Tailored to optimize power transmission on each frame size.

Expresses clearance of the frame over obstacles.

The greater the bottom bracket drop, the lower the rider's center of gravity.

Tailored to optimize weight distribution on each frame size.

Because some people still feel they need to know.
